

CASE STUDY: BOOKSTORE

You are hired as a junior developer at "ReadMore Books", a small bookstore that needs a simple database system. The owner explains: "We need to track our book inventory - each book has a title, ISBN number, price, number of pages, the year it was published, and whether it's currently in stock. We also want to keep information about the authors we work with, including their first and last names, email addresses, a short biography, and their date of birth. Finally, we organize our books into different categories - each category has a name, description, and we need to know if the category is still active or not."

Requirements:

- 1. Create a Console Application using Entity Framework Core**
- 2. Use EF Core CONVENTIONS ONLY**
- 3. Use Sql Server as the database provider**
- 4. Identify and create the necessary entities from the case study**
- 5. Create an appropriate DbContext class**
- 6. Demonstrate that the database is created correctly**
