Create A new Solution and solve the following question each in its own region:

Q1: What will this print and explain what happens?

```
double d = 9.99;
int x = (int)d;
Console.WriteLine(x);
```

Q2: This code doesn't compile. Fix it with the smallest change?

```
int n = 5;
double d2 = n / 2;
Console.WriteLine(d2);
```

Q3: You read a number from user input .. Write the correct line to get age as int.

Q4: What happens here and why?

```
string s = "12a";
int x = int.Parse(s);
Console.WriteLine(x);
```

Q5: Complete the code from the previous question so it prints Invalid if conversion into int fails, otherwise prints the number

Q6: What will this print and explain why ?

```
object o = 10;
int a = (int)o;
Console.WriteLine(a + 1);
```

Q7: What will this print and explain why and if there is a problem handle it ?

```
object o = 10;
long x = (long)o;
Console.WriteLine(x);
```

Q8: Fix this to avoid exceptions and print -1 if conversion isn't possible?

```
object o = 10;
long x = o;
Console.WriteLine(x);
```

Q9: What will this print and explain why ?

```
string? name = null;
Console.WriteLine(name?.Length);
```

Q10: What will this print and explain the process?

```
string? name2 = null;
int length = name2?.Length ?? 0
```

Q11: What's wrong with this "safe" code and how can we solve it ?

```
//string? s = null;
//int x = int.Parse(s ?? "0");
//Console.WriteLine(x);
```

Q12: What happens here and if there is a problem, handle it

```
//string? s = null;
//Console.WriteLine(s!.Length);
```

Q13: What will this print?

```
//string? s = null;
//int x = Convert.ToInt32(s);
//Console.WriteLine(x);
```

Q14: Compare results and explain each result :

```
//string? s = null;

// A
// int a = int.Parse(s);

// B
//int b = Convert.ToInt32(s);
//Console.WriteLine(b);
```

Q15: Complete the line to print "Guest" when user is null, otherwise print the user name in uppercase:

```
string? user = null;
```
